

OPERATIVE REPORT

PATIENT NAME: MARIA BERMUDEZ DOMINGUEZ
DATE: MAY 21, 2007
SURGEON: SALVADOR JIMENEZ COLON, MD, FACS
PREOPERATIVE DIAGNOSIS: CORONARY ARTERY DISEASE
OPERATION PERFORMED: TRIPLE CORONARY ARTERY BY PASS OFF PUMP
(OM; LAD WITH LIMA; RCA)

OPERATIVE FINDINGS: MUGA showed LVEF= 0.42. Catherization showed that the RCA had two proximal eccentric lesions and plaques in the mid and distal portion. The LAD was calcified down to its mid portion - an area that had a lesion. There also a lesion in the proximal third and an apical lesion. The CX gave one OM which had a subtotal proximal lesion. During surgery the saphenous vein, LIMA and aorta were of good quality. There was mild cardiomegaly and large amount of epicardial adipose tissue. The OM was 1.75 mm; the LAD, RPD and RPL had palpable lesions along the vessels. The RCA had distal plaques. The target vessels were sub-optimal. The LAD was 1.5mm; the RCA 2.0mm.

OPERATIVE PROCEDURE: The patient was prepped and draped under general anesthesia in the supine position. The chest was entered through a mid-sternotomy. The LIMA was dissected on its pedicle without entering pleural space. Simultaneously the saphenous vein was harvested from the left lower extremity. The pericardium was opened to the right of the midline. The patient was heparinized. Using the Guidant Axis and Xpose systems the distal anastomoses to the OM (1.75mm), LAD (1.5), RCA (2.0mm); were established with 7-0 prolene. The LIMA was anastomosed to the LAD. The proximal anastomoses were performed with 5-0 prolene using a partial occlusion clamp. A temporary pacemaker wire was implanted in the diaphragmatic portion of the RV and exteriorized through the chest wall. Protamine was administered through the peripheral vein and hemostasis was secured. The pericardial flap was approximated to the pleura. A no. 32 chest tube was inserted in the pericardium and exteriorized through the chest wall. The chest was closed with 5ga. wire for the sternum, no.1 vicryl for fascia, 3-0 vicryl for the subcutaneous tissue and 3-0 for the skin. The leg wounds were closed with 3-0 vicryl and 4-0 for the skin. Dressings were applied and the patient was returned to the ICU in good condition.

To Whom It May Concern:

This is to certify
that Maria Bermudez
Dominguez, female 65
years of age, was treated
by me from Oct. 28 1984 to
Sept. 01, 2000.

Maria is a type I diabetic
with history also of hypertension,
atherosclerotic heart disease,
and osteoarthritis. In
July of 2000 she had a
transient ischemic attack.
(TIA).

At patient's request I
make this report.
